

CodeWeaver comparison with SACTOR

SACTOR's Appendix Table 14 identifies an exact 50-project CRUST-Bench subset, enabling an exact-subject CodeWeaver re-analysis. All 150 CodeWeaver cells compiled; 92/150 passed every fixed project test. CodeWeaver's end-to-end project metric and static safety scan are not pooled with SACTOR's function-level, two-stage, conditionally evaluated idiomatic metric.

Denominator discipline

SACTOR evaluates 966 functions in its unidiomatic stage, then only the 32 fully successful samples in its idiomatic stage. CodeWeaver evaluates all 50 projects in every repetition against 319 fixed project tests. These denominators remain explicit.

Safety metric

CodeWeaver SafeRate is the line-weighted fraction of nonblank production Rust outside unsafe functions or blocks. SACTOR reports unsafe-free programs and average unsafe fraction with its own analyzer. The intent overlaps, but the implementations are not assumed identical.

Exact CodeWeaver measurements

Run	Build	Pass all	Fixed tests	Unsafe-free	SafeRate
CodeWeaver rep 1	50/50	31/50 (62.00%)	297/319 (93.10%)	41/50	99.83%
CodeWeaver rep 2	50/50	31/50 (62.00%)	304/319 (95.30%)	43/50	99.77%
CodeWeaver rep 3	50/50	30/50 (60.00%)	285/319 (89.34%)	40/50	99.68%

SACTOR Table 2 comparison boundary

System	Unit	Function success	Complete samples	Unsafe-free	Note
SACTOR unidiomatic	function	81.57%	32/50 (64.00%)	0%	heavy unsafe
SACTOR idiomatic	function, conditional	42.93%	8/32 (25.00%)	100%	32 survivors only
CodeWeaver rep 1	whole project	N/A	31/50	41/50	99.83%
CodeWeaver rep 2	whole project	N/A	31/50	43/50	99.77%
CodeWeaver rep 3	whole project	N/A	30/50	40/50	99.68%
